

LUMINA 120^{SS}

Lumina 120 BACKLIGHT is a deeper single, sided lightbox for wallmounting, free standing or to be built into an existing structure. All the LEDs, drivers and all electrics are mounted to a rear panel inside the unit underneath the fabric image.

Despite this unit having only single sided illumination, a fabric can be push fitted to the rear to cover any structure if this part of the lightbox is visible.

Lumina 120 accepts push fit fabrics. It can be built to almost any bespoke size and is supplied either complete or in sections for re-assembly on site.

The 120mm deep profile is supplied with an anodised aluminium finish, however, we also stock a satin black and satin white powdercoat finish. The profile can also be powder coated to any RAL colour.

All lightboxes utilise a 24 volt LED system that is safety tested before despatch and a certificate will be supplied. They will also have a unique serial number in case of issues in the field.

The LEDs allow the use of very slim lightboxes whilst housing the drivers internally and maintaining a perfect spread of light with no shadowing.
